विषय: ५८७ वीं राज्य स्तरीय विशेषज्ञ मूल्यांकन समिति की बैठक दिनांक 02 अगस्त 2022 एवं
५८९ वीं राज्य स्तरीय विशेषज्ञ मूल्यांकन समिति की बैठक दिनांक 17 अगस्त 2022 के
रांगध में।

संदर्भ: आपके द्वारा दिये गये निर्देश दिनांक 02.08.2022 एवं 17.08.2022

उपरोक्त विषयांकिता निवेदन है कि ५८७ वीं राज्य स्तरीय विशेषज्ञ मूल्यांकन समिति की
दिनांक 02.08.2022 एवं ५८९ वीं राज्य स्तरीय विशेषज्ञ मूल्यांकन समिति की दिनांक 17.08.2022
को आयोजित बैठक में जिला भोपाल की नवीन जिला सर्वेक्षण रिपोर्ट 2022 (रेत खनिज) के संबंध
में सुझाई गई अनुशंसाओं के तारतम्य में जानकारी तैयार कर अपडेट किये जाने हेतु निर्देशित
किया गया है।

अतः जिला सर्वेक्षण रिपोर्ट को समिति द्वारा सुझाई गई अनुशंसाओं को बिन्दुवार अपडेट
किया जाने के लिए डॉ.एस.आर. रिपोर्ट आगामी कार्यवाही हेतु आपकी ओर सादर प्रेषित है।

संलग्न = उपरोक्तानुसार।

District Survey Report: Bhopal

District Survey Report: Bhopal

1 Introduction

In pursuance to the Gazette Notification, Ministry of Environment, Forest and Climate Change (MoEF & CC), the Government of India Notification No S.O. 141 (E) Appendix- X, Dated 15.01.2016 & S.O. 3611 (E) New Delhi, 25th July 2018 laid procedure for preparation of District Survey Report of sand mining or river bed mining. The main purpose of preparation of District Survey Report (DSR) is to identify the Sand resources and developing the sand mining activities along with other relevant data of the district.

The process of making a DSR includes:

- Collection of baseline data from the department
- Development of related maps from satellite and secondary sources
- Understanding river flows and sedimentation vis-à-vis sand mining
- Tabulation and mapping of existing sand mining locations and yield
- Correlation with satellite data for pre and post monsoon sand yield
- Suggesting new locations for sand mining approvals
- Design and Development of DSR as per MoEF guidelines
- Interaction with line department for data / document ownership

Guidelines to Monitor Sand Mining

For the first time, the Ministry of Environment, Forests and Climate Change (MoEFCC) has released guidelines to monitor and check illegal sand mining in the country.

- Sustainable Sand Management Guidelines (SSMG), 2016 focuses on the management of sand mining, but there was a need to have guidelines for effective enforcement of regulatory provisions and their monitoring.
- The 2020 guidelines are to be enforced simultaneously with the SSMG, 2016, in case of conflict; the new set will hold legal precedence. The Mines and Minerals (Development and Regulation) Act, 1957 has empowered state governments to make rules to prevent illegal mining, transportation and storage of minerals.
- However, there were a large number of illegal mining cases in the country and in some cases, many of the officers lost their lives while executing their duties to curb illegal mining.
- Illegal and uncontrolled illegal mining also leads to loss of revenue to the State and degradation of the environment.

District Survey Report: Bhopal

Enforcement and Monitoring Guidelines for Sand Mining 2020

The fair and rapid advancement of technology in country has enabled surveillance and remote monitoring in the field of mining for the effective monitoring of the mining activities, particularly, sand mining. States are now utilizing remote sensing to prevent illegal mining. Rules have been made to prevent illegal mining, transportation and storage of minerals but in the recent past, it has been observed that there was large number of illegal mining cases in the country and in some cases, many of the officers lost their lives while executing their duties for curbing illegal mining incidence. The illegal and uncontrolled illegal mining leads to loss of revenue to the State and degradation of the environment. Thus, an effective policy for monitoring of sand mining in the Country has been enforced focusing on the effective monitoring of the sand mining since from the identification of sand mineral sources to its dispatch and end-use by consumers and the general public.

- **Source to Destination Monitoring:** The new set of guidelines focuses on the effective monitoring of sand mining from the identification of sand mineral sources to its dispatch and end-use by consumers and the general public and look at a uniform protocol for the whole country.
- Constantly monitor mining with drones and night surveillance of mining activity through night-vision drones.
- **Audits:** States to carry out river audits and put detailed survey reports of all mining areas in the public domain.
- **Transparency:** Online sales and purchase of sand and other riverbed materials (RBM) for transparency in the process.
- **Enforcement:** It gives directions to states to set up dedicated task forces at district levels.
- In cases where rivers become district boundaries or state boundaries, the districts or states sharing the boundary shall constitute the combined task force for monitoring of mined materials, mining activity and participate in the preparation of District Survey Reports (DSR) by providing appropriate inputs.
- **Sustainability:** Conduct replenishment study for river bed sand in order to nullify the adverse impacts arising due to excessive sand extraction.
- While the Sustainable Sand Mining Guidelines, 2016, require the preparation of District Survey Reports (DSR), which is an important initial step before grant of mining lease, the government has found that the DSRs carried out by state and district administrations are often not comprehensive enough, allowing space for illegal mining.

District Survey Report: Bhopal

Surrounding Districts

Bhopal is a district of Indian state of Madhya Pradesh. The headquarters of the district is Bhopal which is also the state capital. Guna district in the north of Bhopal district, Vidisha district in North-Eastern, Raisen district in the east and south-east, Sehore district in south and south-west and Rajgarh district in north-west. Bhopal district, spanning over an area of about 2772 km², lies in the central part of the state of Madhya Pradesh. The district lies between North latitude 23°05' and 23°54' and east longitude 77°10' and 77°40', falling in Survey of India Topo sheet No. 55 E.

2019-20	00	00
2020-21	2000	2000
2021-22	2000	2000

6 Formation of sand

Majority of rivers originate from mountains and as they continue their journey with force, through these mountains, the bigger rocks and boulders disintegrate slowly, and over a period of time, starts rolling down as fragments. These fragments become smaller and smaller due to weathering process by water, wind and other rocks. Thus, developed sand particles are transported, washed and stored and again transported during floods and deposited at river beds and largely on river shores. In case the sand deposits are mined / removed, cavities are formed in their place and again filled during next cycle(s) of deposition.

River sand is preferred as a source of sand because of the following factors:

- Cities tend to be located near rivers so transport costs are low, the energy in a river grinds rocks into gravels and sands,
- Eliminating the costly step of mining, grinding, and sorting of rocks
- The material produced by rivers tends to consist of resilient minerals of angular shape that are preferred for construction.

District Survey Report: Bhopal

- Also, offer the advantages of being naturally sorted by grain-size, easily accessible, and able to be transported inexpensively using barges. Despite plentiful supplies of desert sand (Aeolian) which produce materials unsuitable for making concrete.

A meandering stream has a single channel that winds snakelike through its valley. As water flows around these curves, the outer edge of water is moving faster than the inner edge. This creates an erosion surface on the outer edge (a cut bank) and a depositional surface on the inner edge (a point bar). Where the bends of two meanders meet, they bypass the curve of river, creating an oxbow lake which may then be in-filled with over wash sediment.

Meanders change position by eroding sideways and slightly downstream. The sideways movement occurs because the maximum velocity of the stream shifts toward the outside of the bend, causing erosion of the outer bank. At the same time the reduced current at the inside of the meander results in the deposition of coarse sediment, especially sand. Thus by eroding its outer bank and depositing material along its inner bank, a stream moves sideways without changing its channel size. Due to the slope of the channel, erosion is more effective on the downstream side of a meander.

The specific gravity of an aggregate is considered as the measure of strength or quality of the material. Specific gravity is defined as the ratio of weight of a given volume of aggregate to the weight of equal volume of water. Aggregates having low specific gravity are generally weaker than those with aggregates having high specific gravity. This property helps in a general identification of aggregates. The specific gravity of (sand) is considered to be around

2.65 to 2.67. Sand particles composed of quartz have a specific gravity between 2.65 to 2.67. While inorganic clays generally range from 2.70 to 2.80. Soils with large amounts of organic matter or porous particles have specific gravity below 2.60 (Some range as low as 2.00).

Sources of sand

Sand is world's second most consumed natural resource after water. Rapid urbanization and global population growth have created unbound demand for this limited natural resource. With urbanization as key driving factor, construction industry has expanded considerably over the last few decades leading to overuse of river sand for construction purposes. This increasing discrepancy between the need for aggregates in the

District Survey Report: Bhopal

society and scarcity of natural sand due to exhaustion of resources and environmental considerations, has urged concrete manufacturers to look for a suitable and sustainable alternative fine aggregate. The economic and ecological alternative is manufactured sand.

Natural Sources

Natural sand is produced by natural forces, such as river sand and sea sand. Generally, sand found at foot of mountains is more weathered, containing more mud, organic impurities and light substances. Sea sand often contains shells and other impurities, and its components such as the chlorine, sulfate and magnesium salts may cause corrosion of steel bars. All the components will affect the performance of concrete. Sources of sand can be river bed material, de-siltation pits in reservoirs/dams, agricultural land etc. these can be broadly classified as:

Following are the natural types of the sand:

- Pit Sand

This sand is found as deposits in soil and it is obtained by forming pits into soils. It is excavated from a depth of about 1 m to 2 m from ground level. The pit sand consists of sharp angular grains which are free from salts and it proves to be excellent material for mortar or concrete work. For making mortar, the clean pit sand free from organic matter and clay should only be used.

- River Sand

This sand is obtained from banks or beds of rivers. The river sand consists of fine rounded grains probably due to mutual attrition under the action of water current. The colour of river sand is almost white. As river sand is usually available in clean condition, it is widely used for all purposes.

- Sea Sand

This sand is obtained from sea shores. The sea sand, like river sand, consists of fine rounded grains. The colour of sea sand is light brown. The sea sand contains salts. These salts attract moisture from the atmosphere. Such absorption causes dampness, efflorescence and disintegration of work. The sea sand also retards the setting action of cement. Due to all such reasons, it is the general rule to avoid the use of sea sand for engineering purposes except for filling of basement, etc. It can however be used as a local material after being thoroughly washed to remove the salt.

District Survey Report: Bhopal

Manufactured Sand

Manufactured sand (M-Sand) is artificial sand produced from crushing hard stones into small sand sized angular shaped particles (rock particles with a particle size of less than 4.75 mm and is made by artificial crushing and sieving after soil removal treatment), washed and finely graded to be used as construction aggregate. It is a superior alternative to River Sand for construction purpose. The main technical indicators of artificial sand are particle gradation, fineness modulus, stone powder content, void ratio, apparent density, bulk density, methylene blue value (MB), crushing value index, mica content, light-matter content, etc.

District Survey Report: Bhopal

Sand Mining

Sand Mining is an activity referring to the process of the removal of sand from rivers, streams and lakes.

- Sand is mined from beaches and dredged from river beds.
- There are no official figures for the amount of sand mined illegally, but in 2015- 16, there were over 19,000 cases of illegal mining of minor minerals, which include sand, in the country.
- To stop illegal mining, the Ministry of Environment, Forest and Climate Change (MoEF) issued Enforcement and Monitoring Guidelines for Sand mining.
- These guidelines focus on the effective monitoring of the sand mining.

Following considerations shall be kept in mind for sand mining:

- Parts of the river reach that experience deposition or aggradations shall be identified. The Leaseholder/ Environmental Clearance holder may be allowed to extract the sand and gravel deposit in these locations to manage aggradations problem.
- Sand and gravel may be extracted across the entire active channel during the dry season.
- Abandoned stream channels on the terrace and inactive floodplains are to be preferred rather than active channels and their deltas and flood plains. The stream should not be diverted to form the inactive channel.
- Layers of sand which could be removed from the river bed shall depend on the width of the river and replenishment rate of the river.
- Sand shall not be allowed to be extracted where erosion may occur, such as at the concave bank.
- Segments of the braided river system should be used preferably falling within the lateral migration area of the river regime that enhances the feasibility of sediment replenishment.
- Sand and gravel shall not be extracted up to a distance of 1 kilometer (1 km) from major bridges and highways on both sides, or five times (5x) of the span (x) of a bridge/public civil structure (including water intake points) on upstream side and ten times (10x) the span of such bridge on down-stream side, subjected to a minimum of 250 meters on the upstream side and 500 meters

49

District Survey Report: Bhopal

on the downstream side.

- Sand and gravel could be extracted from the downstream of the sand bar at river bends. Retaining the upstream one to two-thirds of the bar and riparian vegetation is accepted as a method to promote channel stability.
- The flood discharge capacity of the river could be maintained in areas where there is a significant flood hazard to existing structures or infrastructure. Sand and gravel mining may be allowed to maintain the natural flow capacity based on surveyed cross-section history. Alternatively, off-channel or floodplain extraction is recommended to allow rivers to replenish the quantity taken out during mining.
- The Piedmont Zone (Bhabhar area) particularly in the Himalayan foothills, where riverbed material is mined, and this sandy-gravelly track constitute excellent conduits and hold the greater potential for groundwater recharge.

Mining in such

Assessment Authority, M.P.
(EPCA)
Parivaran Parisar
E-5, Aitra Colony, Bhopal (M.P.)

District Survey Report: Bhopal

Areas should be preferred in locations selected away from the channel bank stretches.

- Mining depth should be restricted to 3 meters and distance from the bank should be $\frac{1}{4}$ th or river width and should not be less than 7.5 meters.
- Demarcation of mining area with pillars and geo-referencing should be done prior to the start of mining.
- A buffer distance/un-mined block of 50 meters after every block of 1000 meters over which mining is undertaken or at such distance as may be directed/prescribed by the regulatory authority shall be maintained.
- River bed sand mining shall be restricted within the central $\frac{3}{4}$ th width of the river/rivulet or 7.5 meters (inward) from river banks but up to 10% of the width of the river, as the case may be and decided by regulatory authority while granting environmental clearance in consultation with irrigation department. Regulating authority while regulating the zone of river bed mining shall ensure that the objective to minimize the effects of riverbank erosion and consequential channel migration are achieved to the extent possible. In general, the area for removal of minerals shall not exceed 60% of the mine lease area, and any deviation or relaxation in this regard shall be adequately supported by the scientific report.
- The mining from the area outside river bed shall be permitted subject to the condition that a safety margin of two meters (2 m) shall be maintained above the groundwater table while undertaking mining and no mining operation shall be permissible below this level unless specific permission is obtained from the Competent Authority. Further, the mining should not exceed nine-meter (9 m) at any point in time.
- The permanent boundary pillars need to be erected after identification of an area of aggradations and deposition outside the bank of the river at a safe location for future surveying. The distance between boundary pillars on each side of the bank shall not be more than 100 meters.

8 Land utilization Pattern in the District: Forest, Agricultural, Mining, etc.,

Land use/land cover (LULC) changes are main issues of universal environment change. The Satellite remote sensing data with their monotonous nature have proved to be rather useful in mapping land use/land cover decorations and changes with time. Quantification of such changes is conceivable through GIS techniques even if the subsequent spatial datasets are of dissimilar scales or resolutions. Such studies have helped in considerate the dynamics of human happenings in space and time. Land use refers to man's activities.

Table 8 Land Use Pattern of the Study Area

Sr. No.	Class	Area in Ha.	Percentage of coverage
1	Agricultural Plantation	3.313111	0.00 %
2	Aquaculture	13.966815	0.01 %

9 Physiography of the District

Bhopal district forms the part of Malwa plateau with generally an undulating topography. The Vindhyan hill range occupies the eastern part of Phanda block, including a major part of Bhopal city. In ancient days the range was known as Vindhyyandri, forming the southern boundary of the Madhy Desha or middle region. The highest elevation of 622 m amsl in the district is recorded at Singar Choli, a hillock of Vindhyan range near Bhopal airport. The lowest elevation in the district is recorded about 421 m amsl near village Padariya Jat in Phanda block.

10 Rainfall of the District and Climate Conditions

Rainfall

On the basis of Bairagarh and Berasia rain gauge stations data, the average annual rainfall of Bhopal district is about 1126.7 mm, while based on IMD station at Bairagarh; the annual normal rainfall of Bhopal is 1260.2 mm. Bhopal receives maximum rainfall during southwest monsoon period. About 92 % of the total rainfall takes place only during the monsoon period. The maximum rainfall (about 39 %) takes place during the month of July. In winter occasional rainfall of about 6 % takes place. During summer only about 2 % of the annual rainfall takes place. Thus, from October to middle of June only about 8 % of the annual rainfall takes place.

Climatic Conditions

The climate of Bhopal district is characterized by a hot summer and well-distributed rainfall during the southwest monsoon season. The year can be divided in to four seasons. The winter commences from middle of November and lasts till the end of February. The period from March to about first week of June is the summer season. May is the hottest month of the year. The southwest monsoon starts from middle of June and lasts till end of September. October and middle of November constitute the post monsoon or retreating monsoon season. The climate of the Bhopal district is classified by the Thornthwaite precipitation effectiveness method. It is based on the assumption that total monthly rainfall and temperature determine the climate. The annual precipitation effectiveness of the district is 63.7, which indicate that the climate in the district is humid and forest type vegetation. The temperature starts rising from the beginning of February and reaching maximum in the month of May. The normal daily

District Survey Report: Bhopal

mean monthly maximum temperature is 40.7°C and daily mean minimum temperature is 25.3°C. The individual day maximum temperature in May goes up to 44°C. The individual day minimum temperature is recorded 10.2°C in the month of January. The summer season is the driest period of the year. The humidity comes down lowest in April. It varies between 26% and 88% at different time in different seasons. The wind velocity is high during the monsoon period as compared to pre and post monsoon. The wind velocity is highest in June around 18.9 km/hr and lowest is 7.0 km/hr in November.

11 Geology of the District

The rocks of the Vindhyan Super Group are exposed in the southern and southeastern part of district, including the area in and around Bhopal city. These rocks form NW-SE trending ridges and small isolated hillocks (inliers). The Upper Bhander sandstone is reddish brown to purple in color, massive, medium to coarse grained, exhibiting well-defined bedding with plenty of current bedding and occasional ripple marks. The strike of the formation varies from NNW-SSW to N-S with dips varying from nearly horizontal to 50° in eastern direction. The sandstone is highly jointed with four sets of prominent vertical joints in NW-SE, WNW- ESE, NE-SW and NNE-SSW directions and nearly horizontal bedding joint. The Deccan trap basalts occur in the district as lava flow infillings in the valleys of pre-existing Vindhyan topography. The Vindhyan sandstone show 'baking effect' due to the hot lava coming in contact with sandstones as seen near Bhadbhada. The lava flows are mostly 'Pahoehoe' character and less of 'Aa' character. The individual lava flow ranges from 10 to 30 m in thickness and consist generally of two units i.e., the upper most vesicular/amygduroid basalts with their weathering top portion often overlain by grey or red clay and the massive thin amygdular layer (with pipe amygdulars) towards the bottom. Localized patches of alluvium cover occur along the banks of major and minor rivers and streams in the district. In general, it is difficult to differentiate between alluvium and product of black cotton soil underlain by yellow clay with kankar. In Misrod valley the thickness of this alluvium/colluvium reaches up to 30 m.

12 Drainage and Irrigation Pattern

Drainage Pattern

The district covers part of two river sub-basins. Betwa river sub basin covers 82 % of the area and lower Chambal basin covers 18 % area of district. The district is drained by river Betwa with its main tributaries like Kaliasot, Kerwa, Ajnal, Bah, Halali and Kolans. River Parwati forms the northwestern boundary of the district and its main tributaries Mawal and Ulti drain the area.

Irrigation Practices

Irrigation is the artificial application of water to the soil for normal growth of plants. Water is an important determinant factor for production of crops in agriculture sector. Intensive and extensive cultivation of land depends mainly on the availability of water. Medium and minor irrigation schemes are implemented in the state for augmenting the water supply for agriculture. The various sources of irrigation are canals, tanks, tube wells, ordinary wells, springs and channels.

13 Surface Water and Ground water scenario of the district

Ground Water

Ground Water is found beneath the earth's surface and is an important source of water in most of the Districts in the State. Ground Water is withdrawn for Agriculture, Municipal and industrial use. The depth at which the ground water occurs is called **Ground water Table**.

Variation of groundwater levels in an area is an important component of hydrological cycle because it is a physical reflection of aquifer systems. As the change in groundwater level is directly related to groundwater balance and its continuous records provide direct information of subsurface geo-environmental changes due to withdrawal of groundwater.

The pre-monsoon depth to water level in Bhopal district ranges between 5.15 m bgl at Balrampurghati to 18.4 m bgl at Islamnagar in Phanda block. The most part of both blocks of the district have water level in the range of 10-18 m bgl during the pre-monsoon. The northern part of district in Berasia block and eastern part of district in Phanda block have the water level in the range of 5-10 m bgl. During post-monsoon period, the water level ranges from 1.24 m bgl at Balrampurghati to 11.61 m bgl at Islamnagar. It is observed that in most part of the district the water level lies between 5 to 10 m bgl during this period. In the central part of Phanda block the water level lies between 10-13 m bgl. However, in the eastern part of Phanda block and southeastern part of Berasia block the water level lies between 0.5-6 m bgl. A comparison of pre-monsoon water level data with the post-monsoon water level data reveals that there is rise of water level in entire district during post-monsoon (0.02-2.5 m/year rise) while fall during pre-monsoon (0.08-0.37m/year fall).

Surface Water

The district covers part of two river sub-basins. Betwa river sub basin covers 82 % of the area and lower Chambal basin covers 18 % area of district. The district is drained by river Betwa with its main tributaries like Kaliasot, Kerwa, Ajnal, Bah, Halali and Kolans. River Parwati forms the northwestern boundary of the district and its main tributaries Mawal and Ulti drain the area.

15 Details of Eco – Sensitive Area, if any, in the district

Van Vihar National Park is a national park in Bhopal, the capital city of Madhya Pradesh in central India. Declared a national park in 1979, it covers an area of about 4.45 km². It has the status of a national park, but is developed and managed as a modern zoological park, following the guidelines of the Central Zoo Authority. Animals are kept in near natural habitats. Most animals are either orphaned and brought from various parts of the state or are exchanged from other zoos. No animal is deliberately captured from the forest.

16 Impact on the Environment due to Mining Activity

Generally, the Environmental impacts can be categorized as either primary or secondary. Primary impacts are those, which are attributed directly by the project, secondary impacts are those, which are indirectly induced and typically include the associated investment and changed pattern of social and economic activities by the proposed action.

The impact has been ascertained for the project assuming that the pollution due to mining activity has been completely spelled out under the baseline environmental status for the entire ROM which is proposed to exploit from the mines.

Air

Mining Operations are carried out by opencast semi mechanized/ Mechanized method, dust particles are generated due to various activities like, Excavation, Loading, handling of mineral and transportation. The air quality in the mining area depends upon the nature and concentration of emissions and meteorological conditions.

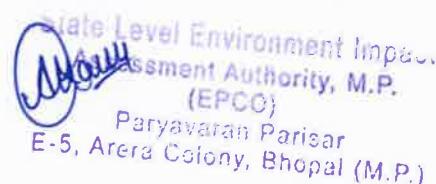

The major air pollutants due to mining activity includes: -

Particulate Matter (Dust) of various sizes.

- Gases, such as, Sulphur Dioxide, Oxides of Nitrogen, Carbon Monoxide etc., from vehicular exhaust.
- Dust is the single Air pollutant observed in the open cast mines. Diesel operating drilling machines, small amount of blasting and movement of machinery/ vehicles produce gaseous (NO_x and SO_x) emissions, usually at low levels. Dust can be of significant nuisance surrounding land users and potential health risk in some circumstances.

Water Impact

The mining operation leads to intersection of the water table which causes ground water depletion. Due to the interruption surface water sources like River, Nallah, Odai etc., surface water system, Drainage pattern of the area is altered.

District Survey Report: Bhopal

Noise

Noise pollution is mainly due to operation of Machineries and occasional plying of machineries. These activities will create Noise pollution in the surrounding area.

Land Environment

The topography of the area will change; due to the Topographical changes the entire Eco system will be altered.

Flora and Fauna

The impact on biodiversity is difficult to quantify because of its diverse and dynamic characteristics.

Mining activities generally result in the deforestation, land degradation, water, air and noise pollution which directly or indirectly affect the faunal and floral status of the project area.

However, occurrence and magnitude of these impacts are entirely dependent upon the project location, mode of operation and technology involved.

17 Remedial Measure to mitigate the impact of Mining on the Environment:

Air

Mitigated measures suggested for air pollution controls are based on the baseline ambient air quality of the area

The following measures are proposed to be adopted in the mines such as,

- Dust generation shall be reduced by using sharp teeth of shovels.
- Wet drilling shall be carried out to contain the dust.
- Controlled blasting techniques shall be adopted.
- Water spraying on haul roads, service roads and overburden dumps will help in reducing considerable dust pollution.
- Proper and regular maintenance of mining equipment's have to be considered.
- Transport of material in trucks covered with tarpaulin

State Level Environment Impact
Assessment Authority, M.P.
(EPCA)
No. 25, Arera Colony, Bhopal (M.P.)
Paryavaran Parisar

District Survey Report: Bhopal

- The mine pit water can be utilized for dust suppression in and around mine areas.
- Information on wind direction and meteorology will be considered while planning, so that pollutants, which cannot be fully suppressed by engineering technique, will be prevented from reaching the nearby agriculture area.
- Comprehensive green belt around overburden dumps has to be carried out to reduce fugitive dust emissions in order to create clean and healthy environment.

Water

- Construction of garland drains to divert surface run-off into the mining area.
- Construction of check dams / gully plugs at strategic places to arrest silt washoff from broken up area.
- Retaining walls with weep hole will be constructed around the mine boundaries to arrest silt wash off.
- The mined out pits shall be converted into the water reservoir at the end of mine life. This will help in recharging ground water table by acting as a water harvesting structure.
- Periodic analysis of mine pit water and ground water quality in nearby villages.
- Domestic sewage from site office & urinals/latrines provided in ML is discharged in septic tank followed by soak pits.

Noise

- Periodic maintenance of machinery, equipment shall be ensured to keep the noise generated at minimum.
- Development of thick green belt around mining area and haul roads to reduce the noise.
- Provision of earplugs to workers exposed to high noise generating activities. Workers and operators at work site will be provided with earmuffs.
- Conducting periodical medical check-up of all workers for any noise related health problems.
- Proper training to personnel to create awareness about adverse noise level effects.

District Survey Report: Bhopal

- Periodic noise monitoring at suitable locations in the mining area and nearby habitations to assess efficacy of adopted control measures.
- During the blasting, optimum spacing, burden and charging of holes will be made under the supervision of competent qualified mines foreman, mate as approved by Director of Mines safety.

Land Environment

- Riparian vegetation should be developed that doesn't stress with changes overshoot period of time.
- Safety barrier zone should be left out in order to prevent quick sand condition or rapid erosion of river banks.
- Development of suitable greenbelt in safety and barrier zone
- Waste dumps should be stabilized taking proper measures
- Degradation of land environment should be checked by briefing the worker about routine works regarding cleanliness and proper mining measures.
- No such infrastructure or any construction should be done that might hinder the natural flow of the river.

Biological Environment

- Development of gap filling saplings in the safety barrier left around the quarry area.
- Carrying out thick greenbelt with local flora species predominantly with long canopy leaves on the inactive mined out upper benches.
- Development of dense poly-culture plantation using local flora species in the mining area at conceptual stage.
- Adoption of suitable air pollution control measures as suggested above.
- Transport of materials in trucks covered with tarpaulin.
- Construction of gully drains and settling tank to arrest silt wash off from lease area.
- Construction of retention walls around lower boundary of mining area to arrest silt wash off and roll down boulders.
- Retaining walls with weep hole will be constructed around the mine boundaries to arrest silt wash off.

District Survey Report: Bhopal

18 Reclamation of Mined out area

There is no proposal for backfilling, reclamation and rehabilitation. The quarry pit should be fenced by barbed wire to prevent inherent entry of public and cattle. The quarried out pit will be allowed to collect rain and seepage water which act as a reservoir for storage. The Quarried pit may be used as water reservoir for both Domestic and Agriculture purpose, in case of stone mining and inland sand mining. For Rover sand mining, the quarry should be demarcated using pillars and left for replenishment during monsoon season. No mining should be undertaken during monsoon period to avoid accidents and mishaps.

19 Details of the area of where there is cluster of mining lease viz no. mining lease Location.

No cluster in sand mine.

21 Sand Replenishment Plan and Projections

Sand Replenishment Assessment

The process of sand replenishment is highly dependent upon the rainfall received in the catchment areas of rivers and their tributaries and velocity of river. It is a dynamic process. Thus it is difficult to predict, what quantity of sand may be reclaimed/replenished by river. Because, in case of less rain, less water in the river, there may be less erosion and transportation may also be minimal and as a result deposition too will be less. Moreover, in case of floods, the sudden gush of water may force the change in river course, thus old sites of sand deposition may not be relevant. Thus, the above figures may just be a mere prediction, based on the production in the preceding years. More so, practically, it is not possible that in such a short period, single person can visit each spot within the district and determine how much quantity of sand may be replenished every year. The data narrated in the report, regarding annual deposition of sand and associated aggregates and minable mineral potential is concerned, is only an estimation based on the production data provided by the district mining office. Thus, the figures may vary from area to area and year on year basis. Therefore, this document is not a static one but have to be a dynamic one, the figures of which may vary with respect to the area under question for which the prior environmental clearance will be sought.

In order to establish a safe extraction limit, such that the extracted sand gets replenished annually, a replenishment study is to be carried out. For this purpose, the river bed RL at selected points in the dry portion of riverbed will be measured during pre-monsoon period and again during post-monsoon period in order to assess the annual quantum of sand deposition. If it is observed that, there is an average increase in riverbed RL, it shows that it is due to deposition of sand during the monsoon flow of the river and by multiplying it with the area of lease one can measure the quantity of sand replenished every year.

Sand quarrying from the river bed will have both positive and negative impacts.NEGATIVE IMPACTS

It includes destruction of natural river course, sand erosion, bank erosion, bank cutting and widening and deepening of river bed, change in hydrological status and recharging conditions and destruction to closely linked flora, fauna and aquatic life.

District Survey Report: Bhopal

POSITIVE IMPACTS

Employment and socio-economic status of the habitats living besides the river depends on sand mining industries. Construction of concrete infrastructure, roads and some other related activities depends on the river bed sand. Continuous accumulation of sand ultimately leads to

the reduction in water carrying capacity of the river leading excessive flood in the river. Sustainable extraction of sand from river will lead to overcoming the problem.

Initially replenishment study requires four surveys. The first survey needs to be carried out in the month of April for recording the level of mining lease before the monsoon. The second survey is at the time of closing of mines for monsoon season. This survey will provide the quantity of the material excavated before the offset of monsoon. The third survey needs to be carried out after the monsoon to know the quantum of material deposited/replenished in the mining lease. The fourth survey at the end of March to know the quantity of material excavated during the financial year. For the subsequent years, there will be a requirement of only three surveys. The results of year-wise surveys help the state government to establish the replenishment rate of the river. Based on the replenishment rate future auction may be planned. The replenishment period may vary on nature of the channel and season of deposition arising due to variation in the flow. Such period and season may vary on the geographical and precipitation characteristic of the region and requires to be defined by the local agencies preferable with the help of the Central Water Commission and Indian Meteorological Department. The excavation will, therefore, be limited to estimated replenishment estimated with consideration of other regulatory provisions.

22 Need for Sand Replenishment Study and Factors to be considered

Environmental status of the mined out area may be affected badly if proper care is not taken to ensure sustainable extraction of sand from river bed. Proper study of the following factors must be taken into consideration to reveal the actual potential of sand deposition in river course after completion of periodical excavation annually. The main factors to be considered for the study of the replenishment potential of particular river course are:

District Survey Report: Bhopal

Formation of sand comprises of the following:

- Catchment area and geographical strata
- Erosion, weathering and transportation of load
- Climatic conditions, precipitation
- Geomorphology, physiographic manmade structures and activity details

Deposition/sedimentation of material or sediment yield depends upon several factors

like:

- Catchment area
- Span of river/ flood plain
- Travelling distance of suspended particles
- Slope/gradient/ depth of water channel;/meandering of river
- Geology traversed
- Climatic conditions
- Tributaries/ confluence
- Type/ stage of river and flow velocity
- Flow during lean period

Table 13 Block Wise Details of Aggradations and Degradations

Aggradation (Pre-Monsoon)				Degradation (Post-Monsoon)			
Sr. No.	Block Name	Total Area in sq. m.	Depth After Aggradation	Total Quantity in Cub. m.	Total Area in sq.m.	Depth After Degradation	Total Quantity in Cub. m.
1	Berasia	1,00,000	0.10	9999.26	1,00,000	0.50	29998

Based on the study presented above about aggregation & degradation and the specific studies for each mine during the preparation of mining plan, the areas of prohibition for mining can be found out. The areas facing aggregation are possible and promising areas for mining of sand whereas the areas facing severe degradation are to be left out and should be left undisturbed. Mining should not be allowed at such location.

Table 14 Drainage System with description of main Rivers

S. NO.	Name of the River	Area Drained	Area Drained in the District
1	Parbati River Basin	9979 sq. km.	4002 sq. km.
2	Kali sindh River Basin	7489 sq. km.	2162 sq. km.

Table 15 Salient Features of Important Rivers and Streams

S. NO.	Name of the River or Stream	Total Length in the District (in km)	Place of Origin	Altitude at origin
1	Parbati River Basin	68 km	Vindhyan Range, Sehore	610 m
2	Kali sindh River Basin	77 km	Vindhyan Range near Bagli in Dewas district	556 m

Table 16 Details of the Concession area in the district

Name of River or Stream	Portion of the River or Stream Recommended for Mineral Concession	Length of area recommended for mineral concession (in meters.)	Average width of area recommended for mineral concession (in meters)	Area recommended for mineral concession (in m ²)	Total Volume in c.m	Mineable mineral potential (in m ³ (60 % of total mineral potential))	(In Metric Ton) in Cubic Meter (60 % of total mineral potential) Cu.mt X 1.4 = MT	Annual Sand Production in last Three Year (in Cubic Meter)			
								2019-20	2020-21	2021-22	
Parbati	Ghoghalpur	636.97	78.49	49995.77 X 0.5	24998	14999	20998	3750	3750	Nil.	
Kali sindh	Manpura	1352	36.98	49996.96 X 0.5	24998.48	14999	20999	3750	3750	Nil.	

Note- In Bhopal District, mineral Sand is found in form of Bajri, which contains a large amount of gravels, boulders and soil. Practically it is not possible to mine out sand only from these deposits. To obtain sand from these deposits, one has to screen out the whole material. The recovery percentage is very low in comparison with the mines area. In this process 75% of material consists of boulder, gravel and soil, and rest 25% material consists of sand (bajri). Also in sand mines of Bhopal, sand is not found in a continuous manner thus mineral potential calculated by mines area largely differs from the actual sand quantity available. Present calculation of sand quantity available based on the field observations and study. Even though the recovery of sand from these mines is very low, these mines have been included in the auction, to curb illegal mining.

District Survey Report: Bhopal

23 Risk Assessment & Disaster Management Plan:

The Disaster Management Plan (DMP) is supposed to be a dynamic, changing, document focusing on continual improvement of emergency response planning and arrangements.

The disaster management plan is aimed to ensure safety of life, protection of environment, protection of installation, restoration of production and salvage operations in this same order of priorities. For effective implementation of the disaster management plan, it should be widely circulated and personnel training through rehearsals/induction conducted by the respective department from time to time.

General Responsibilities during an Emergency

During an emergency, it becomes more enhanced and pronounced when an emergency warning is raised, the workers in-charge, should adopt safe and emergency shut down and attend any prescribed duty as essential employee. If no such responsibility is assigned, he should adopt a safe course to assembly point and await instructions. He should not resort to spread panic. On the other hand, he must assist emergency personnel towards objectives of DMP.

Co-ordination with Local Authorities

The mine manager who is responsible for emergency will always keep a jeep ready at site. In case any eventualities the victim will be taken to the nearby hospitals after carrying out the first aid at site. A certified first aid certificate holder will be responsible to carry out the first aid at site. The mine manager should collect and have adequate information of the nearby hospitals, fire station, police station, village Panchayat heads, taxi stands, medical shop, district revenue authorities etc., and use them efficiently during the case of emergency.

Plantation and Green Belt Development in respect of lease granted in the District:

Mining activities result in pollution of the environment. This requires protection of our environment. Plantation is the oldest technology for the restoration of the land damaged by the human activities as well as air pollution.

Trees are highly suitable for the detection and monitoring of the air pollutants and have been

District Survey Report: Bhopal

effectively used at various places

By planting trees we can achieve the dual purpose of bio aesthetics as well as mitigation of pollution. Proper planning and plantation scheme depends upon the magnitude and type of pollution, selection of pollution tolerant and dust capturing plants

The plants should be ever green, large leaved, with rough bark, ecologically compatible, with low water requirement, requiring minimum care, capable to absorb pollutants, pollutant resistant, agro climatically suitable, fast growing, free from wind throw and breakage and with high pollution tolerance index. The specious should be suitable to the climate, topography and soil. A minimum two rows of plantation will be carried out to minimize the effect of pollution. This would attenuate the pollutants level.

प्रति,

कलेक्टर

जिला - भोपाल (म.प्र.)

विषय: नवीन जिला सर्वेक्षण रिपोर्ट - भोपाल (रेत खनिज)

संदर्भ: आपका पत्र क्र. 2435, दिनांक 17.08.2022।

राज्य स्तरीय समाधात निर्धारण प्राधिकरण द्वारा 745वी बैठक दिनांक 05.09.2022 में निम्नानुसार निर्णय लिया गया :-

राज्य स्तरीय विशेषज्ञ मूल्यांकन समिति (SEAC) की 590वीं बैठक दिनांक 26/08/2022 में जिला भोपाल की जिला सर्वेक्षण रिपोर्ट में निम्नानुसार सुझाव सहित अनुशंसा की गई है।

चर्चा उपरांत समिति ने पाया कि भोपाल जिले की जिला सर्वेक्षण रिपोर्ट पर आमजन के सुझाव आंमत्रित कर इनका अनुमोदन जिले में गठित समिति द्वारा किया जा चुका है तथा खनि. अधिकारी, कार्यालय कलेक्टर, (खनिज शाखा) जिला- भोपाल पत्र 2435 दिनांक 17/08/22 के माध्यम से मिनरल पोटेंशियल की गणना में आवश्यक संशोधन कर रेत की 60 प्रतिशत माइनेबल पोटेंशियल (रेत खनन हेतु) मीट्रिक टन यूनिट में प्रस्तुत कर दी गई है मिनरल पोटेंशियल की गणना दर्शने वाली टेबल में आवश्यक संशोधन कर रेत की 60 प्रतिशत माइनेबल पोटेंशियल (रेत खनन हेतु) मीट्रिक टन यूनिट में प्रस्तुत कर दी गई है। समिति की यह गी अनुशंसा है कि जिला स्तर पर जिला सर्वेक्षण रिपोर्ट तैयार करने हेतु गठित जिला समिति की अनुशंसा तथा की गई रिप्लेनिशमेंट स्टडी की जानकारी (जिसके आधार पर जिला सर्वेक्षण रिपोर्ट तैयार की गई है) संबंधित जिला खनिज अधिकारी कार्यालय में सुरक्षित रखी जाये।

अतः समिति द्वारा सुझाव गई उपरोक्त अनुशंसाओं के साथ भोपाल जिले की जिला सर्वेक्षण रिपोर्ट (रेत खनिज) अनुमोदन हेतु विचारार्थ एवं आगामी कार्यवाही हेतु राज्य स्तरीय पर्यावरण समाधात निर्धारण प्राधिकरण की ओर प्रेषित की जाये।"

राज्य स्तरीय समाधात निर्धारण प्राधिकरण (SEIAA) द्वारा विस्तृत चर्चा एवं विचार विमर्श उपरांत SEAC की 590वीं बैठक दिनांक 26/08/2022 की अनुशंसा को मान्य करते हुए भोपाल जिले की अद्यतन जिला सर्वेक्षण रिपोर्ट का अनुमोदन SEAC द्वारा सुझाई की उपरोक्त अनुशंसाओं के साथ किया जाता है। तदानुसार जिला कलेक्टर, भोपाल को पुनरीक्षित जिला सर्वेक्षण रिपोर्ट जिला पोर्टल पर अपलोड करवाये जाने एवं संचालक भौमिकी तथा खनिकर्म को सूचित किया जाये।

उपरोक्त निर्णयानुसार कृपया अनुमोदित नवीन जिला सर्वेक्षण रिपोर्ट जिला पोर्टल पर अपलोड करने का कार्य करें। सुलभ संदर्भ हेतु अनुमोदित नवीन जिला सर्वेक्षण रिपोर्ट की साफ्टकॉपी ई-मेल के माध्यम से आपकी ओर प्रेषित है।

सदस्य सचिव

**राज्य स्तरीय पर्यावरण समाधात निर्धारण प्राधिकरण म.प्र. की 745वीं बैठक दिनांक 05.09.2022
का कार्यवाही विवरण**

अतः समिति द्वारा सुझाव गई उपरोक्त अनुशंसाओं के साथ भोपाल जिले की जिला सर्वेक्षण रिपोर्ट (रेत खनिज) अनुमोदन हेतु विचारार्थ एवं आगामी कार्यवाही हेतु राज्य स्तरीय पर्यावरण समाधात निर्धारण प्राधिकरण की ओर प्रेषित की जाये।

राज्य स्तरीय समाधात निर्धारण प्राधिकरण (SEIAA) द्वारा विस्तृत चर्चा एवं विचार विमर्श उपरांत SEAC की 590वीं बैठक दिनांक 26/08/2022 की अनुशंसा को मान्य करते हुए भोपाल जिले की अद्यतन जिला सर्वेक्षण रिपोर्ट का अनुमोदन SEAC द्वारा सुझाई की उपरोक्त अनुशंसाओं के साथ किया जाता है।

तदानुसार जिला कलेक्टर, भोपाल को पुनरीक्षित जिला सर्वेक्षण रिपोर्ट जिला पोर्टल पर अपलोड करवाये जाने एवं संघालक औभिकी तथा खनिकर्म को सूचित किया जाये।

17. जिला सर्वेक्षण रिपोर्ट, जिला - सीधी (रेत खनिज)

राज्य स्तरीय समाधात निर्धारण प्राधिकरण द्वारा 745वीं बैठक दिनांक 05.09.2022 में निम्नानुसार निर्णय लिया गया :-

राज्य स्तरीय विशेषज्ञ मूल्यांकन समिति (SEAC) की 590वीं बैठक दिनांक 26/08/2022 में जिला सीधी की जिला सर्वेक्षण रिपोर्ट में निम्नानुसार सुझाव सहित अनुशंसा की गई है।

..... समिति ने जिला सर्वेक्षण रिपोर्टों के प्रस्तुतीकरण एवं परीक्षण में पाया कि रेत की कई स्थीकृत खदानों में 60 प्रतिशत माइनेबल पोटेंशियल तथा विगत 03 से 05 वर्षों के उत्पादन की मात्रा में 10 गुना से भी अधिक का अंतर है जिसके सदर्भ में उपस्थित खनन अधिकारियों द्वारा बताया गया कि विगत 02 से 03 वर्षों में कोविड महामारी, जाग कम होने इत्यादि के कारण कुछ खदानों से रेत की निकासी काफी कम हुई है जिस कारण यह अंतर परिलक्षित हो रहा है। समिति ने चर्चा उपरांत निर्णय लिया कि रेत खनन के ऐसे प्रकरण जहां 60 प्रतिशत माइनेबल पोटेंशियल तथा विगत 03 से 05 वर्षों के उत्पादन की मात्रा में 05 गुना या उससे से भी अधिक का अंतर है ऐसे सभी प्रकरणों में पर्यावरणीय अभिस्थीकृती हेतु प्रकरण ॲन लाईन प्रस्तुत करते समय उनकी अनुमोदित खनन योजना में उस स्थल की सारांभित रिस्लेनिशमेंट स्टडी प्रस्तुत की जाये तथा 60 प्रतिशत माइनेबल पोटेंशियल के विरुद्ध 05 गुना या उससे से भी अधिक रेत की मात्रा के अंतर का औचित्य दर्शाया जाये।

समिति की यह भी अनुशंसा है कि जिला स्तर पर जिला सर्वेक्षण रिपोर्ट तैयार करने हेतु गठित जिला समिति की अनुशंसा तथा की गई रिस्लेनिशमेंट स्टडी की जानकारी (जिसके आधार पर जिला सर्वेक्षण रिपोर्ट तैयार की गई है) संबंधित जिला खनिज अधिकारी कार्यालय में सुरक्षित रखी जाये।

अतः समिति द्वारा सुझाव गई उपरोक्त अनुशंसाओं के साथ सीधी जिले की जिला सर्वेक्षण रिपोर्ट (रेत खनिज) अनुमोदन हेतु विचारार्थ एवं आगामी कार्यवाही हेतु राज्य स्तरीय पर्यावरण समाधात निर्धारण प्राधिकरण की ओर प्रेषित की जाये।

राज्य स्तरीय समाधात निर्धारण प्राधिकरण (SEIAA) द्वारा विस्तृत चर्चा एवं विचार विमर्श उपरांत SEAC की 590वीं बैठक दिनांक 26/08/2022 की अनुशंसा को मान्य करते हुए सीधी जिले की

(श्रीमन् शुक्ला)
सदस्य सचिव

(अरुण कुमार भट्ट)
अध्यक्ष

**राज्य स्तरीय पर्यावरण समाधात निर्धारण प्राधिकरण म.प्र. की 745वीं बैठक दिनांक 05.09.2022
का कार्यवाही विवरण**

खदानों में 60 प्रतिशत माइनेबल पोटेंशियल तथा विगत 03 से 05 वर्षों के उत्पादन को मात्रा में 10 गुना से भी अधिक का अंतर है जिसके सदर्न में उपरिथित खनन अधिकारियों द्वारा बताया गया कि विगत 02 से 03 वर्षों में कोविड महामारी, मान कम होने इत्यादि के कारण कुछ खदानों से रेत की निकासी काफी कम हुई हैं जिस कारण यह अंतर परिलक्षित हो रहा है। समिति ने चर्चा उपरात निर्णय लिया कि रेत खनन के ऐसे प्रकरण जहां 60 प्रतिशत माइनेबल पोटेंशियल तथा विगत 03 से 05 वर्षों के उत्पादन को मात्रा में 05 गुना या उससे से भी अधिक का अंतर हैं ऐसे सभी प्रकरणों में पर्यावरणीय अभिस्वीकृती हेतु प्रकरण औन लाईन प्रस्तुत करते समय उनकी अनुमोदित खनन योजना में उस स्थल की सारांगीत रिप्लोनिशमेंट स्टडी प्रस्तुत की जाये तथा 60 प्रतिशत माइनेबल पोटेंशियल के लिए 05 गुना या उससे से भी अधिक रेत की मात्रा का अंतर का औचित्य दर्शाया जाये।

समिति की यह भी अनुशासा है कि जिला स्तर पर जिला सर्वेक्षण रिपोर्ट तैयार करने हेतु गठित जिला समिति की अनुशासा तथा की गई रिप्लोनिशमेंट स्टडी की जानकारी (जिसके आधार पर जिला सर्वेक्षण रिपोर्ट तैयार की गई है) सबधित जिला खनिज अधिकारी कार्यालय में सुरक्षित रखी जाये।

अतः समिति द्वारा सुझाव गई उपरोक्त अनुशासाओं के साथ उमरिया जिले की जिला सर्वेक्षण रिपोर्ट (रत खनिज) अनुमोदन हेतु विचारार्थ एवं आगामी कार्यवाही हेतु राज्य स्तरीय पर्यावरण समाधात निर्धारण प्राधिकरण की ओर प्रेषित की जाये।

राज्य स्तरीय समाधात निर्धारण प्राधिकरण (SEIAA) द्वारा विस्तृत चर्चा एवं विचार विमर्श उपरात SEAC की 590वीं बैठक दिनांक 26/08/2022 की अनुशंसा को मान्य करते हुए उमरिया जिले की अद्यतन जिला सर्वेक्षण रिपोर्ट का अनुमोदन SEAC द्वारा सुझाई की उपरोक्त अनुशंसाओं के साथ किया जाता है।

तदानुसार जिला कलेक्टर, उमरिया को पुनरीक्षित जिला सर्वेक्षण रिपोर्ट जिला पोर्टल पर अपलोड करवाये जाने एवं संचालक भौमिकी तथा खनिकर्म को सूचित किया जाये।

16. जिला सर्वेक्षण रिपोर्ट, जिला - भोपाल (रत खनिज)

राज्य स्तरीय समाधात निर्धारण प्राधिकरण द्वारा 745वीं बैठक दिनांक 05.09.2022 में निम्नानुसार निर्णय लिया गया :-

राज्य स्तरीय विशेषज्ञ मूल्यांकन समिति (SEAC) की 590वीं बैठक दिनांक 26/08/2022 में जिला भोपाल की जिला सर्वेक्षण रिपोर्ट में निम्नानुसार सुझाव सहित अनुशंसा की गई है।

चर्चा उपरात समिति ने पाया कि भोपाल जिले की जिला सर्वेक्षण रिपोर्ट पर आमजन के सुझाव आमत्रित कर इनका अनुमोदन जिले में गठित समिति द्वारा किया जा चुका हैं तथा खनि. अधिकारी, कार्यालय कलेक्टर(खनिज शाखा) जिला- भोपाल पत्र 2435 दिनांक 17/08/22 के माध्यम से मिनरल पोटेंशियल की गणना में आवश्यक सशोधन कर रेत की 60 प्रतिशत माइनेबल पोटेंशियल (रेत खनन हेतु) मीट्रिक टन यूनिट में प्रस्तुत कर दी गई है। मीट्रिक टन यूनिट में प्रस्तुत कर दी गई है मिनरल पोटेंशियल की गणना दर्शाने वाली टेबल में आवश्यक सशोधन कर रेत की 60 प्रतिशत माइनेबल पोटेंशियल (रेत खनन हेतु) मीट्रिक टन यूनिट में प्रस्तुत कर दी गई है। समिति की यह भी अनुशासा है कि जिला स्तर पर जिला सर्वेक्षण रिपोर्ट तैयार करने हेतु गठित जिला समिति की अनुशंसा तथा की गई रिप्लोनिशमेंट स्टडी की जानकारी (जिसके आधार पर जिला सर्वेक्षण रिपोर्ट तैयार की गई है) सबधित जिला खनिज अधिकारी कार्यालय में सुरक्षित रखी जाये।
